CERTIFIED MAIL

Mr. Donald Seeberger
Department of Ecology
3190 160th Ave SE
Bellevue WA 98008-5452

Dear Mr. Seeberger:

In response to your letter date May 17th, 1995 concerning the Burlington Environmental Pier 91 Facility inspection of April 13, 1995, your issues have been corrected as follows.

Issue #1

Secondary containment for the 90 day accumulation area in building #27.

A steel containment pan was placed in building #27 to contain material for 90 day storage on June 2, 1995. The containment pan was removed once all 90 day waste containers were removed on August 7, 1995, prior to closing the operations at the facility. The pan was removed before a photograph could be taken.

Issue #2

Ecology has not received a certification which demonstrates that the 90 day accumulation area in building #19 has been adequately decontaminated.

As we indicated during the development of the interim status closure plan, Burlington contends that decontamination of the warehouse concrete should not be required. However, in order to resolve this issue, Burlington proposes to obtain a concrete chip sample from the drum accumulation area of Building #19. This sample will be analyzed for BTEX, PCBs, TPH, and TCLP metals. Burlington will forward the analytical results to Ecology upon completion.

Sincerely,

John Stiller
Regulatory Affairs Manager
